King Island District High School

As I wander I spot...

Danger for little feet, hidden
amongst the sand and rocks

Laying in the sand, water washing over, not going to go away.

Fishing debris left behind, was it snagged or discarded?

Hidden in cracks, not escaping after the storms

Which one looks good for
dinner?

Amazing what is underneath, it is not the natural but the unnatural that you have to watch!

Rubbish on the rock.

For my topic, I have chosen rubbish. Ocean rubbish is a big problem on our beaches. Because 70% of Earth is ocean, what we do on land ends up in the ocean.

One million plastic bags are used every minute then thrown away! In a decade scientist have predicted there will be more plastic bags in the ocean than creatures. This is horrible! If this doesn't stop soon, we will have no clean oceans or beaches. We are all to blame for the situation. People always think that plastic will disappear, but it only gets smaller and smaller and never goes away.

This is something none of us want, so now the big question is HOW? How can we fix this? Everyone needs to help clean up, each one of us is responsible for our rubbish. We need to Reduce, Re-use and Recycle. Rubbish has changed our Earth and this is something we can't get away with until it's fixed.

Do you want this to keep going or keep the amazing features of our oceans and our creatures in their home?

1. Plastic on the beach
